

Quickdr@w External Termination Unit (ETU)

The Quickdr@w External Termination Unit provides an outdoor connection point that enables the active equipment at the customer premise to be located indoors. This enables triple play services (voice, data and video including home management services and video-on-demand) over FTTH.

The unit is located externally, accepts the feed from a pre-connectorised lead-in assembly (LIA) from the external network and feeds pigtailed through the wall fabric to the ONU that manages local (home) facilities.

Key Features

- Rapid plug-in connection using LIA (factory fitted connectors) avoids fusion splicing
- Network on Demand – install unit (activation) when service contract signed
- External location supports easy installation
- Active equipment can be safely located indoors
- Locked unit prevents access
